

# Track to Slat Matching (continued)

good matches =  
hatched area over background line

efficiency = good matches/all matches

- correctness-of-match efficiency:
  - 30 to 60 %, for all DDC tracks
  - 70 to 90 %, for long DDC tracks (defined as  $N_{hits} > 80$ )
- trend of match efficiency vs. hole number
  - mirrors trend of occupancy vs. hole number
